

ABSTRACT

5 A bonded abrasive tool, having a structure permeable to fluid flow,
comprises sintered agglomerates of a plurality of abrasive grains and a binding
material, the binding material being characterized by a melting temperature
between 500 and 1400° C, and the sintered agglomerates having a loose
packing density of ≤ 1.6 g/cc and three-dimensional shape; a bond material; and
10 about 35-80 volume % total porosity, including at least 30 volume %
interconnected porosity. Methods for making the sintered agglomerates and
abrasive tools containing the sintered agglomerates are described.
